

The Neuroscience of Conflict: How to Keep Everyone Calm, Cool & Collected

Neuroscience is an increasingly useful topic for mediators. No matter what the conflict, the common denominator is people. Conflict often triggers a stress response in parties to a mediation. Mediators must be equipped to effectively deal with the emotions and reactions that arise during the mediation process.

The concepts identified by neuroscience are complemented by the study of social neuroscience. Social neuroscience examines neuroscience methods and theories and applies them to human behavior to understand how we think and act, with a focus on how we think about and act toward other people.

This presentation will apply neuroscience and social neuroscience to the mediation process, with an emphasis on techniques to help parties stay focused.
